

ABSTRACT OF THE DISCLOSURE

A restaurant table turn control and display system for providing real-time communication to staff personnel throughout key areas of a restaurant, comprising two or more monitoring consoles, each having a restaurant layout display having indicia representative of tables available for seating in the restaurant and for communicating to the staff other requirements or needs; a touch screen for activating desired status changes on the system; LED bulbs arranged in an underlying relationship to the indicia on the restaurant layout or software driven images depicted on the display screen, which can be a combination monitor and touch screen; and a controller circuit with programmable circuitry for operating and controlling the system, including providing status changes and communicating such status changes simultaneously to other monitoring consoles electrically operatively connected to said monitoring console.
